ABSTRACT
Background: Ca++ channels and calcium signalling appears to play a critical role in the differentiation and functions of osteoclasts and osteoblasts and L-type voltage dependent calcium channels (VDCC) are expressed on bone cells. Either activation or blocking of these channels in bone homeostasis is found to be controversial. Based upon this we have compared effects of VDCC antagonist (-) Verapamil and VDCC agonist (+) Bay-K-8644 against ovariectomy (OVX) induced bone loss in female Wister rats. Methods: Present study was designed as per the food and administration guidelines for ovariectomy rat model and test drug administration period was 40 days. At the end of the experiment various parameters were compared among the groups. Results: Among all the drugs calcium channel agonist CCA (+) Bay-K-8644 has shown protective effects by increase in the bone density, breaking strength and maintaining serum calcium, phosphorous and ALP level. Calcium channel blockers (CCB) (-) Verapamil has also offered protection in few parameters like bone length but not as good as Bay-K-8644. Conclusion: CCA (+) Bay-K-8644 has offered protection may be by reducing opening frequency, current amplitude of Cav 1.2 channels. Moreover it may have elevated cytosolic Ca++ in osteoblast cells and decreases RANK-L induced osteoclast formation and bone resorption.

Key words: Bay-K-8644, Ca++ channels, Osteoblast, Osteoclast, Verapamil.

INTRODUCTION
Osteoporosis is a condition portrayed by diminished bone density, is common among postmenopausal ladies additionally happens in men and women with basic conditions or real hazard elements connected with bone mineralization. Its major clinical manifestations are vertebral and hip fractures, although fractures can occur at any skeletal site. Loss of bone tissue causes deterioration in the architecture of the skeleton, the combination leading to markedly increased risk of fracture.1 Osteoporosis is a major and growing public health problem in developed nations. Many women (30-50%) and men (15-30%) suffer a fracture related to osteoporosis.2 The bone mineralization and resorption are strictly controlled by osteoblast and osteoclast cells. Recently L-type of calcium channels are identified on osteoblast cell line3-4 but precise role of these channels in bone biology is contradicted, explained below. It’s the topic of discussion for many researchers across the world to explore exact role of these existing Ca++ channels in bone homeostasis. It’s well known fact intracellular calcium ions play many roles in human physiology. Few of the earlier research favors that intracellular calcium ions in osteoclast cells prevents the bone resorption. Calcitonin, IL-4 and protein tyrosine kinase inhibitors suppress osteoclasts activity by acutely increasing the intracellular Ca++ concentration in osteoblast cells indicating increased intracellular Ca++ concentration has an inhibitory role in osteoclasts function subsequent bone resorption. Thus, an increase in intracellular Ca++ concentrations in osteoblast cells is generally accepted as a potential mechanism by which various agents inhibit osteoclasts activity.5-7 Moreover, Long et al., 2011 has stated that calcium channel agonist increased the calcium ion threshold for the effective activation of NFATc1 (nuclear factor of activated T-cells) by stimulating Ca++ ion influx through L-type calcium channels, resulting in decreased osteoclasts formation.8 However, Ritchie et al., 1994 has found that dihydropyridine calcium channel blockers are shown to suppress bone resorption by the direct inhibition of osteoclast function.9 Parathyroid hormone is one of the key regulator of osteoclastic bone resorption mechanism which was sharply reduced by the treatment of amiodipine a L-type calcium channel blocker.10 Even in our earlier research we noticed that CCB has inhibitory role in bone resorption. From these statements it has been understood that few scientist suggests that CCB’S (-) are useful in the management of osteoporosis and few suggesting CCA (+) are useful. Based upon these debatable statements we have used best CCB (-) at the best dose from our earlier experiment i.e. Verapamil (2.11 mg/kg) and compared with CCA (+) i.e. Bay-K-8644 (0.05 mg/kg) against OVX induced osteoporosis by considering serum Ca++, P and ALP levels and bone parameters such as bone density, breaking strength, diameter and length. Histopathological examinations were also studied by keeping same experimental conditions.
MATERIALS AND METHODS

Materials

Experimental animals: Female Wister Albino rats

Chemicals: Bay-K-8644 purchased from Sigma Aldrich batch number 112613; Verapamil HCL was used as marketed preparation as Calpatin-40, Piramal Healthcare Ltd, FADA2001; Estradiol valerate was purchased from, local market as Progynon depot inj, Candila Health care Ltd. GM2436; Calcium kit, Transasia Bio-Medicals Ltd; Phosphorous kit, Crest Biosystems; Alkaline phosphatase kit, IRIS Healthcare Tech. Pvt. Ltd.

Instruments and lab wares: Surgical Sutures and catgut (0.2) were purchased from Frank Health Co. Ltd.; Blood collecting vials, Research centrifuge REMI CM – 12; Vernier calipers, MITOTOHO- 532-120; 0.01 sensitivity digital weighing balance, AN ISO 9001; dual energy X-ray absorptiometry (DEXA) apparatus, DEXA 7; Trinacular Microscope, iVU- 3100; Semi – Auto Analyser, ES- 100; Muffle furnace, PMTC- 4040; UV-Visible spectrophotometer, T-70; Flame photometer, PFP7 etc.

Methods

Selection of the animals

Thirty female Wistar albino rats of 3-4 months old weighing between 200-250 g were procured from central animal house facility of CMR college of Pharmacy, Hyderabad India. Animals were maintained under controlled conditions of constant temperature 21 ± 5°C and relative humidity of 50-55%, 12:12 Hr light/dark cycle. The rats were acclimatized for 10 days and have free access to chow and water. CPCSEA guidelines were strictly followed and the project is approved by the Institutional animal ethical committee (IAEC), bearing animal ethical clearance number CPCSEA/1657/IAEC/CMRCP/CO12-14/33.

By observing health statuses and normal behavioral parameters for 10 days; healthy, non-pregnant animals were selected for this study by performing vaginal smear test. Ovariectomy (OVX) surgery was performed only in 24 female Wistar rats and remaining 6 animals were treated as normal sham operated control. After surgery all the animals were treated with antibiotics and pain killers for three successive days to avoid any postoperative infection and pain respectively. All the operated animals were maintained for 14 days align time for the estrogen deficiency and induction of osteoporosis. Estrogen deficiency was confirmed by performing vaginal smear test on 14th day of the study to confirm a menopausal pattern in OVX rats and dosing was initiated from 15th day of surgery after recording the health status of the animals.11

Animal grouping

Twenty four OVX rats randomly divided into 4 groups by keeping 6 animals in each group while other 6 animals were treated as normal sham operated control. Group 1 sham operated animals were treated with distilled water (10 ml/kg i.p.);12 group 2 OVX animals were treated as distilled water (10 ml/kg p.o.);12 group 3 OVX animals were treated with standard estradiol valerate (0.1 mg/kg, i.m.);13 group 4 OVX animals were treated with Verapamil HCL (2.11 mg/kg, p.o.)14 and group 5 OVX animals were treated with Bay-K-8644 (0.05 mg/kg, i.p.).15 Selected test and standard drug were administered for successive 40 days in-between 9 to 11 AM to avoid effect of fluctuating neuro-hormonal levels on the drugs. On 41st day various parameters were studied like physical parameters of bone, blood chemistry, histopathological examination and osteoclast count were done.

Ovariectomy surgery procedure

Ovariectomy surgery was performed as per the U.S. FDA guidelines. Briefly two dorso-lateral incisions were made approximately 1 cm long above the ovaries and the peritoneal cavity was accessed, the ovaries were identified surrounded by a variable amount of fat. The surgery was done under the blend anaesthesia of i.e. Ketamine 80 mg/kg, Xylazine 5 mg/kg i.p. The link between the fallopian tube and the uterine horn was cut and the ovary removed out. The stitching was performed by using absorbable catgut 2.0.16

Vaginal Smear Test: Vaginal smear cell counts were performed on 100 cells randomly. The percentage of cornified cells was determined according to Cora et. al 2015 using the following formula:17

\[ \text{Percentage of Cornified Cells} = \frac{\text{Cornified Cells}}{\text{Total Cells}} \times 100 \]

There was no significant difference in the percentage of cornified cells between the groups; it confirmed a menopausal pattern in OVX rats.

Determination of Serum parameters and bone parameter: After 40 days of successful dosing on 41st day calcium, phosphorus and alkaline phosphatase (ALP) were analyzed from serum as per the method prescribed by Miller et.al. 1994.18

On the same day i.e. on 41st day of the study rats were sacrificed by CO2 overdose using euthanasia chambers and right femur, right tibia and 4th lumbar vertebrae were dissected out from all rats.

Bone Parameters:

Measurement of bone Weight, length and outer diameter of diaphysis right Femur: Dissected right femur was cleaned off to remove all surrounding tissues debris. To achieve the constant weight bone were kept in hot oven at 52°C and then weighted on the 0.01 sensitive digital balance. By using digital vernier caliper bone length, outer diameter of diaphysis of right femur and tibia were measured precisely and recorded.13

Bone mineral density (BMD) measurement by DEXA apparatus:

Towards the end of the study bone mineral density estimations was performed by utilizing Ex vivo strategy in double blind methodology by utilizing a Hologic QDR-1000 X-beam bone densitometer (double X-beam wellspring of 70 and 140 kVp) and a ultrahigh determination program with 0.0254 cm line dividing and a point determination of 0.0127 cm.19 Bone mineral density calculations were done for all isolated right femur and compared with normal control and disease control groups.

Determination of breaking strength: Fresh isolated bones (right femur, tibia and 4th lumbar vertebrae) were kept in breaking strength apparatus (Monsanto) until it cracked and the reading were recorded in Newton’s (N).13

Histopathology of femur bone and osteoclast examination: was performed as per the methods prescribed by Magda, 2011 and Suzuki et al. 2010.20

Statistical Analysis

The results are expressed as mean ± SEM. Comparisons between the treatment groups and positive control; positive control and control were performed by one way analysis of variance (ANOVA) followed by Dunnett’s test. In all tests the criterion for statistical significance was p<0.05 (95% level) and p<0.01 was considered. The analysis was performed by using Graph pad Prism V.
RESULTS

Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on serum calcium and Phosphorous level (mmol/L) in female Wistar OVX rats

Serum Ca$^{2+}$ levels declined significantly (P<0.01) in standard estradiol Valerate, 2.64±0.09 and Bay-K-8644, 2.63±0.04 treated groups when compared to disease control group 2.96±0.01. Serum calcium was significantly (P<0.01) high 2.77±0.07 in verapamil treated group compared to Sham operated group. This rise in Ca$^{2+}$ level is may be because of activation of PTH hormone by the verapamil.

The serum phosphorous non- significantly decreased in standard estradiol 1.47±0.06, Verapamil 1.52±0.06 and Bay-K-8644 1.69±0.08 treated group when compared to disease control group 1.71±0.1. (For results please refer Figure 1).

Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on serum alkaline phosphatase (U/L) level in female Wistar OVX rats

The serum Alkaline phosphatase levels significantly (P<0.001) increased in standard estradiol (283.86±1.37), Verapamil (296.84±1.58) and Bay-K-8644 (298.31±0.92) treated groups compared to disease control group 253.86±1.55. (For results please refer Figure 2).

Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on bone weight (gm) in female Wistar OVX rats

Weight of right tibia was significantly (P<0.01) high in Bay-K-8644, 0.516±0.02 treated group when compared to disease control group 0.421±0.03. The bone weight of right tibia is also increased but less significantly (P<0.05) in Verapamil 0.505±0.01 and Bay-K-8644 0.516±0.02 treated groups when compared to sham operated group 0.428±0.01.

The bone weight of right femur was non-significantly increased in standard estradiol, 0.661±0.04; Verapamil, 0.683±0.03 and Bay-K-8644, 0.7±0.04 treated groups compared to disease control group, 0.557±0.02. (For results please refer Figure 3).

Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on bone length (mm) in female Wistar OVX rats

The bone length of right femur (mm) was significantly (P<0.001) high in Bay-K-8644 39.83±0.74 and Verapamil 38.83±0.30 treated groups when compared to disease control group 34.33±0.88.

The bone length of right femur (mm) is also been increased significantly (P<0.01) in standard estradiol 37.16±0.7 treated group when compared to disease control group 36.66±0.91.

The bone length of right tibia (mm) was significantly (P<0.01) high in Bay-K-8644 43.66±0.33 and Verapamil 43.06±0.65 when compared to disease control group 40.83±0.74. (For results please refer Figure 4).

Effect Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on outer diameter of diaphysis of bone (mm) in female Wistar OVX rats

The outer diameter of diaphysis of right femur bone (mm) was significantly (P<0.001) more in Bay-K-8644, 12.16±0.30 and Verapamil 11.0±0.44 when compared to disease control group 7.33±0.42. There is also significant rise in diameter of outer diaphysis of right tibia in Bay-K-8644 (P<0.001, 8±0.51) and Verapamil (P<0.01, 7.83±0.47) when compared to disease control group 5.66±0.42. (For results please refer Figure 5).

Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on breaking strength (N) of bones in female Wistar OVX rats

The breaking strength (N) of 4th lumbar vertebrae, right femur and right tibia was significantly (P<0.001) high in Bay-K-8644 treated (14.25±0.89; 16±0.25 and 17.66±0.69 respectively) group compared to disease control group.
The breaking strength was also found to be significantly high in Bay-K-8644 treated group for all three mentioned bones compared with normal control group.

The breaking strength of 4th lumbar vertebra (P<0.05, 12.58±0.85), right femur (P<0.001, 14.1±0.25) and right tibia (P<0.001, 17.08±0.45) was found to be significantly high in verapamil treated group compared to disease control group 9.25±0.54, 10.5±0.34 and 10.25±0.55 respectively. (For results please refer Figure 6).

**Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on Bone mineral density (g/cm²) in female Wistar OVX rats**

BMD was found to be significantly high in standard estradiol (P<0.01, 0.20±0.0012), verapamil (P<0.05, 169±0.008) and Bay-K-8644 (P<0.05, 193±0.009) treated group when compared with disease control group, 153±0.03 and normal control group, 184±0.002 respectively. (For results please refer Figure 7).

**Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on Ash weight (gm) in female Wistar OVX rats**

Ash content of the right femur was found to be significantly (P<0.001) low in disease control (0.14±0.00) group compared to normal control group, 0.169±0.00. This decrease in the ash value may be because of estrogen deficiency. There was significant (P<0.001) high weight of the ash value in standard estradiol, 0.188±0.00 and Bay-K-8644, 0.195±0.00 treated group compared to disease control group, 0.140±0.00. (For results please refer Figure 8).
Effect of Bay-K-8644 0.05 mg/kg (+) and Verapamil 2.11 mg/kg (-) on Ca\(^{2+}\) content in bone (mg) in female Wistar OVX rats

Calcium (Ca\(^{2+}\)) content of right femur (mg) was significantly (P<0.001) decreased in disease control, 39.98±0.28 and verapamil 35.77±0.28 treated group compared to the sham operated control group, 49.63±2.0. The fall in the Ca\(^{2+}\) content was significantly (P<0.001) elevated by the treatment with standard estradiol, 54.23±0.83 and Bay-K8644, 60.64±0.45 treated group as compared to disease control group, 39.98±0.28. (For results please refer Figure 9).

**DISCUSSION**

According to World Health Organization (WHO), osteoporosis is second only to cardiovascular disease as a global healthcare problem and medical studies show a 50-year-old woman has a similar lifetime risk of dying from hip fracture as from breast cancer.\(^{15}\) International Osteoporosis Foundation (IOF) estimates that the annual direct cost of treating osteoporosis fractures of people in the workplace in the USA, Canada and Europe alone is approximately USD 48 billion.\(^ {22}\)

There is an emergent need to treat this problem in cost effective way. Current study has been under taken to compare the effect of CCA (+) and CCB (-) in bone homeostasis and for the treatment of osteoporosis. In the earlier study which was conducted in our lab we have screened few L-types CCB’s and verapamil at 2.11 mg/kg p.o. has come up as lead molecule which has offered optimum protection against ovariecctomy induced bone loss model of osteoporosis in female Wister rats.\(^ {14}\)

Although L-type Ca\(^{2+}\) channel-related agents regulate osteoclastic activity,\(^ {23,24}\) In bone, Ca\(^{2+}\) has a structural role, since osteoblasts deposit an extracellular matrix (ECM) that contains nucleation sites for mineral deposition but their exact role in the control of bone development and resorption is yet to be established.\(^ {16}\)

Ovariecctomy induced bone loss is one of the well accepted in-vivo pre-clinical model for the primary screening of the investigational drugs as it resembles to the human post-menopausal osteoporosis. Serum Ca\(^{2+}\) levels declined significantly (P<0.001) in standard estradiol valerate, 2.64±0.09 and (+) Bay-K-8644, 2.63±0.04 treated groups when compared to disease control group 2.96±0.01. The increase in the serum Ca\(^{2+}\) level in the disease control group is may be because of the unavailability of the estrogen to promote the osteoblast division and prevent proliferation and differentiation of osteoclast cells. Because of the lack of estrogen there might be rapid bone turnover and subsequent rise in the serum Ca\(^{2+}\) and P levels. By the treatment with standard Estrogen restored Ca\(^{2+}\) loss and balanced Osteoclast and Osteoblast phenomenon. By the treatment with agonists (+) Bay-K-8644, Ca\(^{2+}\) loss was restored and low serum Ca\(^{2+}\) level suggesting less calcium turnover. The possible reason for this protective effect of (+) Bay-K-8644 may be mediated through Parathyroid hormone (PTH). Parathyroid hormone regulates serum Ca\(^{2+}\) and P concentrations through its receptor-mediated, combined actions on bone, intestine and kidney. High levels of PTH, as seen in primary and secondary hyperparathyroidism, increase osteoclastic bone resorption. Low levels, especially if delivered episodically, seem to increase osteoblastic bone formation.\(^ {25,26}\)

Earlier experimental evidence suggests that presence of VDCC exists on parathyroid cell membrane and VDCC respond to plasma calcium. Calcium channels provide a pathway for the movement of calcium across the plasma membrane and that this pool of calcium regulates PTH secretion. Data also suggests that specific VDCC channel agonists like (+) Bay-K-8644 reduced the PTH secretion and antagonists like (-) Verapamil has increases the PTH secretion.\(^ {27}\) Because of the PTH, bone resorption property the serum Ca\(^{2+}\) is more in Verapamil treated group compared to Bay-K-8644 treated group.

Alkaline phosphate (ALP) is one of the sensitive indicator in osteoporosis so in our study we have investigated the serum ALP level in all groups. The serum ALP levels was significantly (p<0.001) elevated only by the Bay-K-8644 (296.84±1.58) treated group but not by the other test groups compared to disease control group 253.86±1.55. The increase in the ALP level is indicating the active bone formation phenomenon because ALP is the by-product while osteoblasts cell division along with the matrix formation which provides strength to the bone.

L-type voltage-sensitive calcium channels, Cav1.2 are present on rat osteoblast like cell line which selectively regulate the entry of the calcium ions in osteoblast cells and involved into osteoblastic cell differentiation and bone development phenomenon.\(^ {29}\) Several lines of evidence have found that bone density increases and that bone resorption decreases when these calcium channels are activated in osteoblast cells.\(^ {29}\) More precisely Verapamil is selective L-type voltage sensitive Calcium channel blocker, Cav1.2 channel which are present on the rat osteoblast cells prevents the calcium entry into the cell and thus may reduce the osteoblast division ALP formation.

On the 41\(^{\text{st}}\) day of the study we have analyzed the breaking strength of 4\(^{\text{th}}\) lumbar, right femur and right tibia. Post-menopausal osteoporotic women mainly affected by fractures occurred in femur bone, tibia, 4\(^{\text{th}}\) lumbar vertebrae that might be because of these bones are mainly involved in support and bear more strain. In our study Bay-K-8644 have shown significant improvement in the breaking strength of 4\(^{\text{th}}\) lumbar, right femur and right tibia compared with both disease control and sham-operated groups respectively. The results obtained with this regard are as per the earlier literatures with respect to disease control group. Moreover, our histopathological study of femur bone supports our results. As per histopathological reports disease control group has shown thinning of trabeculae with tendency of disappearance, loss of connectivity and widening of inter trabular species and less number of the osteoblast cells compared to sham-operated control group. In the standard estrogen treated group microarchitecture of the bone cells are maintained with moderately thick elongated trabeculae and narrowed inter trabular species increased numbers of osteoblasts cells compared to disease control group. Treatment with Bay-K-8644 has also offered protection, no inter trabular species only moderate less osteoclast cells compared with the disease control group. (Refer Figure 10) Along with the bone weight on the same day we have measured the length of right femur and right tibia. Bone length has non-significantly reduced in disease control group compared to normal control group. By the treatment with
(+)-agonist Bay-K-8644 length of right femur and tibia was found to be significantly (p<0.001) more than disease control group. This protection offered by the (+) agonist Bay-K-8644 is may be because it is the L-type Ca\textsuperscript{2+} channel opener reduces the RANKL and RANK interaction and prevents the osteoblasts differentiation so there is less formation of ALP compared to the Verapamil treated group. Earlier study reveals that by the treatment with VDCC blockers drops osteoprotegerin (OPG) production and upsurge in RANK-L production. Both these proteins are given off by osteoblast cells in response to the serum Ca\textsuperscript{2+} level.

Moreover, recent in-vitro study also reveals that Bay-K-8644 increases opening frequency, current amplitude and elevate cytosolic Ca\textsuperscript{2+} ions into the osteoclast cells and decreases RANK-L induced osteoclast formation and also elevate OPG level.\textsuperscript{31,32} Taken together both Calcium channel (-) antagonist and (+) agonist have protective effects on OVX induced bone loss. The differences for the protective effect against OVX-induced bone loss is varies in between Calcium channel (+) agonists and (-) antagonist because of their target sites. Effects of these drugs may also depends upon the quantity of the Ca\textsuperscript{2+} ions into the osteoblast cells. Osteoblasts cells needs Ca\textsuperscript{2+} ions for activation but at the same time overloading of these cells with Ca\textsuperscript{2+} ions may activate the apoptotic pathway that causes cell death.

Ironically, before come to the final conclusion more precise study has to be done with respect to the selection of test drug dose, duration of drug treatment, in-vivo and in-vitro studies has to be run simultaneously. Based upon our finding our results are more inclined towards Bay-K-8644 but more studies are needed to understand precise mechanism and side effects before implementing into the human subjects.

**CONCLUSION**

Ironically, before come to the final conclusion more precise study has to be done with respect to the selection of test drug dose, duration of drug treatment, in-vivo and in-vitro studies has to be run simultaneously. Based upon our finding our results are more inclined towards Bay-K-8644 but more studies are needed to understand precise mechanism and side effects before implementing into the human subjects.
